Warranty and Assistance

The IRS21 LUFFT INTELLIGENT ROAD SURFACE SENSOR is

warranted by CAMPBELL SCIENTIFIC, INC. to be free from defects in materials and workmanship under normal use and service for twelve (12) months from date of shipment unless specified otherwise. Batteries have no warranty. CAMPBELL SCIENTIFIC, INC.'s obligation under this warranty is limited to repairing or replacing (at CAMPBELL SCIENTIFIC, INC.'s option) defective products. The customer shall assume all costs of removing, reinstalling, and shipping defective products to CAMPBELL SCIENTIFIC, INC. CAMPBELL SCIENTIFIC, INC. will return such products by surface carrier prepaid. This warranty shall not apply to any CAMPBELL SCIENTIFIC, INC. products which have been subjected to modification, misuse, neglect, accidents of nature, or shipping damage. This warranty is in lieu of all other warranties, expressed or implied, including warranties of merchantability or fitness for a particular purpose. CAMPBELL SCIENTIFIC, INC. is not liable for special, indirect, incidental, or consequential damages.

Products may not be returned without prior authorization. The following contact information is for US and International customers residing in countries served by Campbell Scientific, Inc. directly. Affiliate companies handle repairs for customers within their territories. Please visit www.campbellsci.com to determine which Campbell Scientific company serves your country. To obtain a Returned Materials Authorization (RMA), contact CAMPBELL SCIENTIFIC, INC., phone (435) 753-2342. After an applications engineer determines the nature of the problem, an RMA number will be issued. Please write this number clearly on the outside of the shipping container. CAMPBELL SCIENTIFIC's shipping address is:

CAMPBELL SCIENTIFIC, INC.

RMA#_____ 815 West 1800 North Logan, Utah 84321-1784

CAMPBELL SCIENTIFIC, INC. does not accept collect calls.

IRS21 Lufft Intelligent Road Surface Sensor

The IRS21 is a sensor that makes measurements of road surface. From

1. Function

Measuring the road surface temperature

FIGURE 1-1. IRS21

2. Specifications

Dimensions:	5" in diameter, and 2" high
Weight:	2 pounds
Survival temperature:	-57° to 158°F (-50° to 70°C)
Rated current:	less than 200 ma
Interface:	RS485
Standard cable length:	75 feet (25m)
Optional cable length:	up to 300' (100M)
Power supply:	9 to 14 Vdc
Operating temperature:	-40° to 158°F (-40° to 70°C)
Operating relative humidity:	100%
Outputs	
Road condition:	dry, damp, wet, snow, freezing wetness, ice
Road temperature: Accuracy Resolution	-40° to 158°F (-40° to 70°C) ±0.2°C (-10° to 10°C); ±0.5°C (-40° to 70°C) 1°C
Freezing point: Accuracy Resolution	-4° to 32°F (-20° to 0°C) ±.1°C 1°C

Needed Accessories

RS485 to RS-232 adapter Lufft pn 8410.KON – Campbell part number 18080 SDM-SIO4

Warranty Exclusions

Due to important installation considerations, the following sensors will not be warranted.

1. Sensors that aren't installed flush with the road surface.

If the road sensor is installed above the road surface, damage to the sensor could result from equipment contacting the sensor.

If the sensor is mounted below the road surface, incorrect measurements are possible due to the pooling effect of material on top of the sensor that is not representative of the road surface.

2. Sensors with exposed sensor cable in the road surface.

Equipment Needed for Installation

- 1. Drill and 5" core bit for the sensor hole.
- 2. Cement/concrete saw for the sensor lead saw cut with 1/2" saw blade.
- 3. Trencher for the sensor lead in the road shoulder.
- 4. Air nozzle to clean the cuts.
- 5. Hammer drill and 1/2" by 24" drill bit for the temperature sensors.
- 6. 115 VAC generator, 5 kW.
- 7. Portable compressor, 9 CFW.

Supplies Needed for Installation

- 1. Backer rod.
- 2. Epoxy.
- 3. PVC pipe for the sensor lead in the road shoulder. This isn't required but adds protection for the cable.
- 4. Chalk line.
- 5. Duct tape.
- 6. Hammer and chisel.

3. Installation

FIGURE 3-1. Core cut for the road sensor.

Hole diameter = 6" Hole depth = 3" Saw cut depth = 2" Saw cut width = 1/2"

Locate the place in the pavement for the sensor. Drill the sensor hole 3" deep, and clear the drilled hole of all excess material.

Saw cut the road surface for the sensor lead. The cut needs to be extended beyond the sensor hole to completely clear the sensor hole of excess material.

FIGURE 3-2. Core drill (A) and saw cutting (B) equipment.

FIGURE 3-3. Saw cut is masked with duct tape to control the epoxies.

FIGURE 3-4. View of fast steel which is placed under the sensor prior to epoxy application to provide a base for the sensor.

The fast steel is used to control the depth that the sensor fits into the sensor hole, and the limiting fixtures on the sensor make the sensor even with the road surface.

FIGURE 3-5. Weights are placed onto the leveling fixtures for the road sensor. One weight is placed on each leveling fixture.

FIGURE 3-6. First pour of Fabick epoxy, pn FJS (fast set), useable between 20° to 180°F.

An Excel worksheet is available on our web site to calculate the amount of epoxy needed. The file is located at <u>www.campbellsci.com/downloads</u>. The first pour of the epoxy fills and assures that there is complete coverage around the sensor and sensor cable. The second pour fills to the road surface.

FIGURE 3-7. Finished pour, with weights removed.

Above is the finished epoxy around the sensor. There is a dam of backer rod that prevents epoxy from draining from around the sensor while filling the sensor hole.

A dam of backer rod also can be used for the sensor cable fill. If there is any banking on the road, this is an effective way to fill the saw cut and the sensor hole to the required height.

FIGURE 3-8. Second pour to bring the epoxy to grade.

After the first pour has hardened, the fixtures on sensor for making the sensor even with the road surface can be removed before adding more epoxy.

FIGURE 3-9. Backer rod is used as a dam to control the epoxy. Different epoxies can be used for directly around the sensor and along the cable. Since the epoxy used is liquid, the backer rod is used to dam the epoxy until cured.

FIGURE 3-10. Compressed air is used to dry and clean the saw cut.

FIGURE 3-11. Application of the sensor cable epoxy. The saw cut is two inches deep. The backer rod is placed in the length of the saw cut below and above the sensor cable before epoxy application.

The backer rod in the saw cut should have a friction fit. When the epoxy fills the saw cut, if there is no friction fit, the backer rod tends to float to the road surface.

FIGURE 3-12. Finished epoxy application.

FIGURE 3-13. A junction box is used when cable splices are needed to extend the cable length.

4. Connections

The interface has a two position dip switch that can change the interface from master to slave operation. For operation with the RWIS station the interface is set to master and each interface takes a port on the SDM-SIO4.

The switches in the two left hand positions as indicated by the X's above make the interface a master.

The sensors can be daisy chained. This is done by writing the address of the sensor with software available only to the manufacturer at this time. The sensor connections are made to the sensor connector.

The input connector and output connectors are used for daisy chain operation, but are also used to supply the 12 volts to the interface and sensor.

In the figure above, power is applied to the input and output connectors. 12 volts is connected to the UB connection of the input connector from the power buss. Ground is connected from the power buss to the GND connection to the output connector.

5. Operation

The sensor is operated at two-minute intervals. This is done to prevent measurement errors from sensor heating that could happen if the sensor were powered too long. The sensor is polled with a command that asks for:

Temperature 1 Temperature 2 Temperature 3 Salt concentration Freezing temperature Water film height Road condition Error status

Sensors purchased for the Campbell Scientific RWIS station are not optioned with the first two temperature sensors. For these applications, 107 probes are used for sub surface temperature measurements. When these are used, one is placed at the bottom of the saw cut near the sensor. The other 107 is placed into the bottom of an 18" deep by 1/2" hole under the 107 probe placed into the saw cut near the IRS21.

The data returned consists of the polling command and ASCII data. Spaces separate the data points.

In typical operation the sensor is run in table two in mixed array loggers, and slow sequence in PakBus loggers. The interval for the sensor is two minutes.

6. Programming

The sensor is first powered with the DTR line set high. Then the RTS is set low to send data to the sensor. In this case the polling command will be sent to the sensor. As soon as the polling command is sent, RTS is set high to get data back from the sensor. In as short a time as is possible by the programming. RTS is set high to receive the data. Then the receive filter is sent to the SDM-SIO4, and data is retrieved by the logger.

In both programs below the SDM-SIO4 is set up with code at the start of the program. This ensures that if there is a reset or power is lost, the startup will configure the SDM-SIO4 without having to connect to the SDM-SIO4 to configure the device.

The calculations after reading the SDM-SIO4 are used to convert raw data measurements from the sensor to measurements such as degrees, and film thickness.

6.1 CR1000 Program

Although this example program is for the CR1000, other CRBasic dataloggers are programmed similarly.
